

MANUAL

An Open Source Air Quality Data Validation and e-Reporting System

Rune Å. Ødegård (NILU)
Jaume Targa (4sfera Innova)

Preface

The Norwegian Institute for Air Research (NILU) has been commissioned to assist European Environmental Agency's work on air quality reporting. With the assistance of 4sfera, an open source tool has been developed Air Quality Raven tool. This document constitutes a User Guide for air quality experts using this tool.

1 Summary

This document constitutes a User Guide for air quality experts using this tool.

The user guide includes:

- Log in
- Group options
- Management of meta-data with RAVEN
- XML generation
- Key elements for AQ e-Reporting

2 Introduction

RAVEN3 is a cross-platform independent air quality monitoring and e-reporting software package, and is tested on Windows, Linux and Mac OS. The overall concept is outlined in the image, below, in figure 1. The main e-reporting component was developed by NILU.

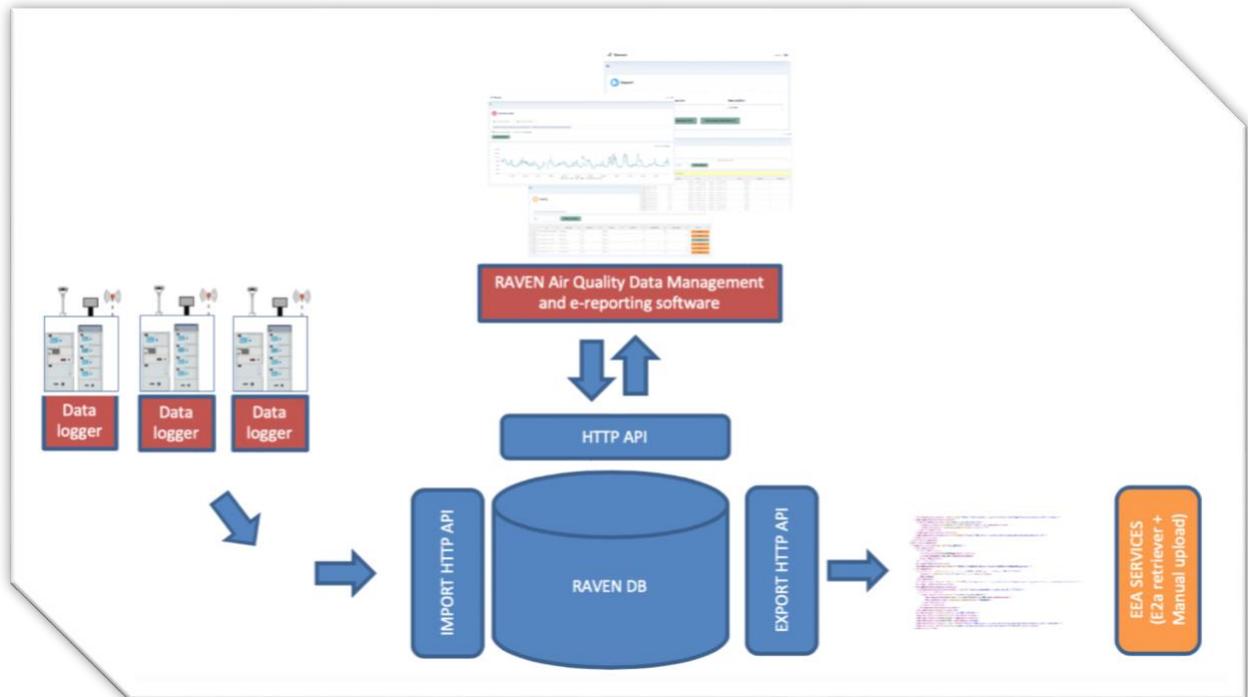

Figure 1: Data flow RAVEN

RAVEN has the following features:

- **Data import with csv files via GUI or API**
- **View and compare data module**
- **GUI for editing the following meta data:**
 - Responsible authorities
 - Networks
 - Stations
 - Sampling Point
 - Process
 - Samples
 - Observation Capabilities
 - Assessment Regimes
 - Attainments
 - Exceedance Description
- **Scaling, including unit conversion and calculate data (needed for NO-NO₂-NO_x)**
- **Validation module**
- **Verification module**
- **XML-generation via download or API for the following dataflows:**
 - information on zones and agglomerations (data flow B)
 - information assessment methods (data flow D)
 - information assessment regimes (data flow C)

- information on attainment of environmental compliance (data flow G)
- primary validated data (data flow E1a)
- primary Up-To-Date data (data flow E2a) NB! Only available through API
- **Users/groups read/write access on network level**

The database was designed as a relational model. The data model is shown in the figure below.

Figure 2: RAVEN database model

The full working software of RAVEN can be found and downloaded under the open source repository GitLab:

- <https://git.nilu.no/raven/raven-administration>

RAVEN Software requirements, installation and user documentation can also be found under:

- <https://git.nilu.no/raven/raven-administration> and
- <https://git.nilu.no/raven/raven-administration/-/tree/master/guides>

A demonstration version can be found at <https://admin.demo.agraven.eu/>

Latest version of this document can be found:

https://git.nilu.no/raven/raven-administration/-/tree/master/guides/Raven_UserGuide.pdf

3 Introduction to e-Reporting

3.1 The legislative back drop

EU Member States are required to monitor and report air quality data under several EU legal instruments. This information is collated, analysed and disseminated by the European Environment Agency (EEA) supported by its European Topic Centre.

The introduction of the Commission's Implementing Decision 2011/850/EU¹ (AQ e-Reporting IPR) created a start point to rationalise, modernise and streamline air quality data reporting,

A key feature of the changes under the new e-Reporting system compared with its predecessor is the introduction of a new mechanism for data transfer. Under the new e-Reporting system data is to be transferred from Member States to the EEA in XML format. The XML schema and data model has been based on the standards, concepts and principles mandated by the INSPIRE Directive.

The AQ e-Reporting IPR came into force on 1 January 2014², two years after adoption of the Decision during which time Member States undertook preliminary tasks and activities to prepare themselves for e-Reporting. It was anticipated that Member States data infrastructure would require adaptation to allow:

1. Integration of data flows;
2. Data delivery that uses the defined transport mechanism (XML).

In recognition of the challenges that the new systems would present to Member States and to manage and facilitate the transition, Member State reporting authorities, their data providers, and the EEA's operational services have worked together to ensure that this transition to the e-Reporting is implemented in an as effective and efficient manner as possible. The EEA will establish and operate the mechanism for sharing air quality information (e-Reporting) in line with the AQD IPR requirements.

3.2 Online resources

To facilitate the implementation of the Decision 2011/850/EU, the European Environment Agency (EEA) has set up the Air Quality Portal to support the transition to e-Reporting. The AQ Portal, managed by ETC, is the central HUB for reporting air quality data across Europe via e-Reporting. The AQ Portal includes online resources for:

- Guidelines & reports for e-Reporting
 - <http://www.eionet.europa.eu/aqportal/toolbox/guidance>
- Controlled code lists and vocabularies for e-Reporting
 - <http://www.eionet.europa.eu/aqportal/toolbox/lists>
- The latest data model & AQD schemata
 - <http://www.eionet.europa.eu/aqportal/toolbox/datamodel>

The Commission has published two guidance notes to facilitate the implementation of the Decision:

¹ http://eur-lex.europa.eu/legal-content/EN/TXT/?uri=uriserv:OJ.L_.2011.335.01.0086.01.ENG

² Although reporting of data flows B, C, and D is encouraged before the end of 2013.

- IPR guidance part I
- http://ec.europa.eu/environment/air/quality/legislation/pdf/IPR_guidance1.pdf
- IPR guidance part II
- http://ec.europa.eu/environment/air/quality/legislation/pdf/IPR_guidance2.pdf

EEA & ETC/ACM keep updated rules for submission at:

<http://www.eionet.europa.eu/aqportal/toolbox/submission/>

EEA & ETC/ACM has a dedicated helpdesk to assist countries at aqipr.helpdesk@eionet.europa.eu

3.3 Reporting data-flows

The AQ e-Reporting IPR integrates different air quality data-flows into the following groups:

- Data flow A – Reporting header & Competent Authority
- Data flow B – Information on zones
- Data flow C – Assessment regimes
- Data flow D– Assessment methods (Fixed and indicative)
- Data flow D1b – Assessment methods (models) – *under development*
- Data flow E1a – Primary validated data
- Data flow E1b – Model/Objective estimation data – *under development*
- Data flow E2a – Primary Up-To-Date data (*via FTP or service*)
- Data flow F – Aggregated data (*Performed by EEA*)
- Data flow G – Attainment
- Data flows H-K – Air quality plans & programmes (*Tool developed by JRC, Ispra*)

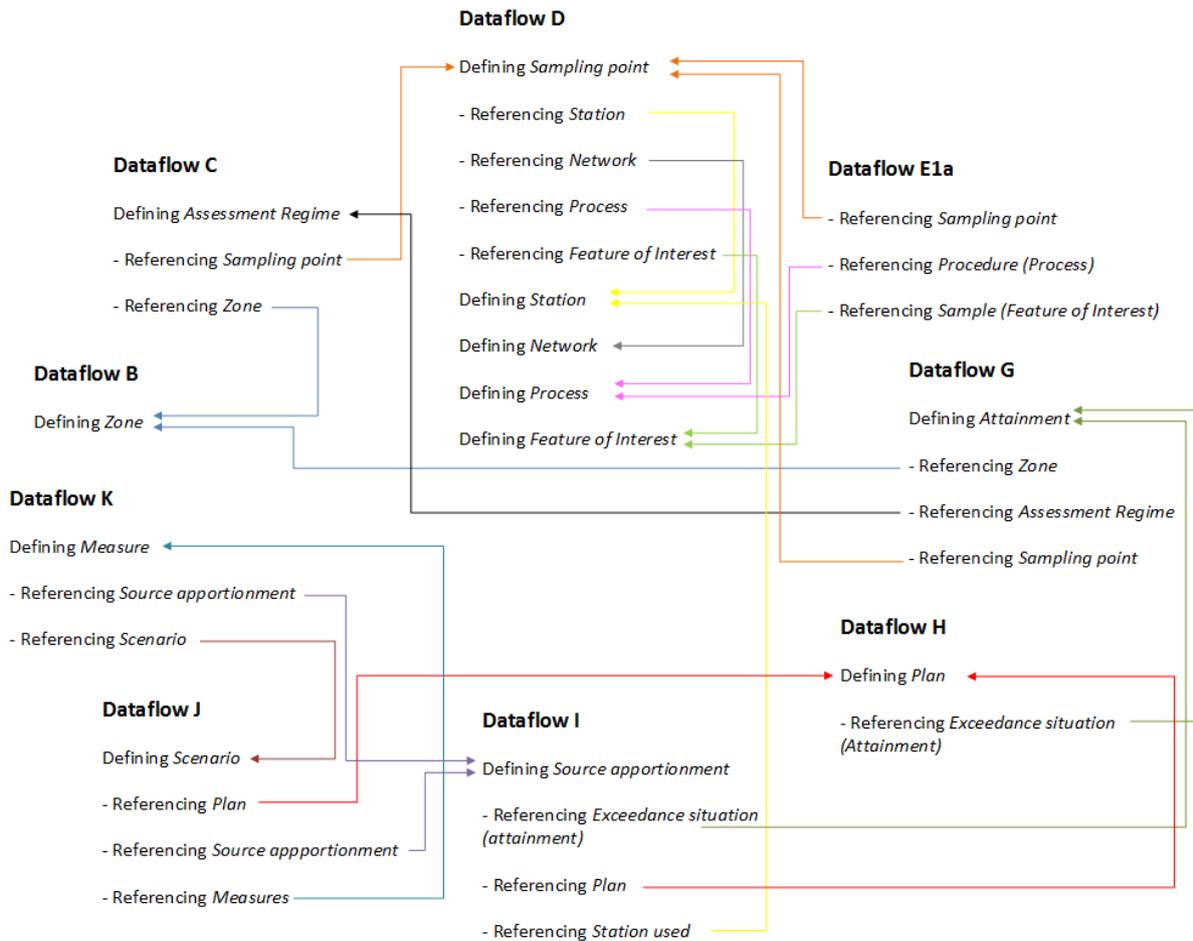

Figure 3: Key linkages between dataflows – diagram from AQ Portal

3.4 Reporting cycle

The air quality data flows are reported following the schedule set out in the Decision. The following data must be submitted accordingly:

- Preliminary data flows B and C containing information on zones and assessment regimes for the coming year YY+1. The deadline for submission is 31 December of year YY.
- Full information related to the previous year YY-1 with the associated data flows B, C, D, D1b, E1a, E1b and G. This delivery must be done by 30 September of year YY.
- Plans and Programs (data flow H-K) for (new) exceedances observed in year YY-2. The deadline for this package is 31 December of year YY.
- Provisional Up-To-Date measurement data (E2a). These data are transmitted hourly throughout the year via ftp.

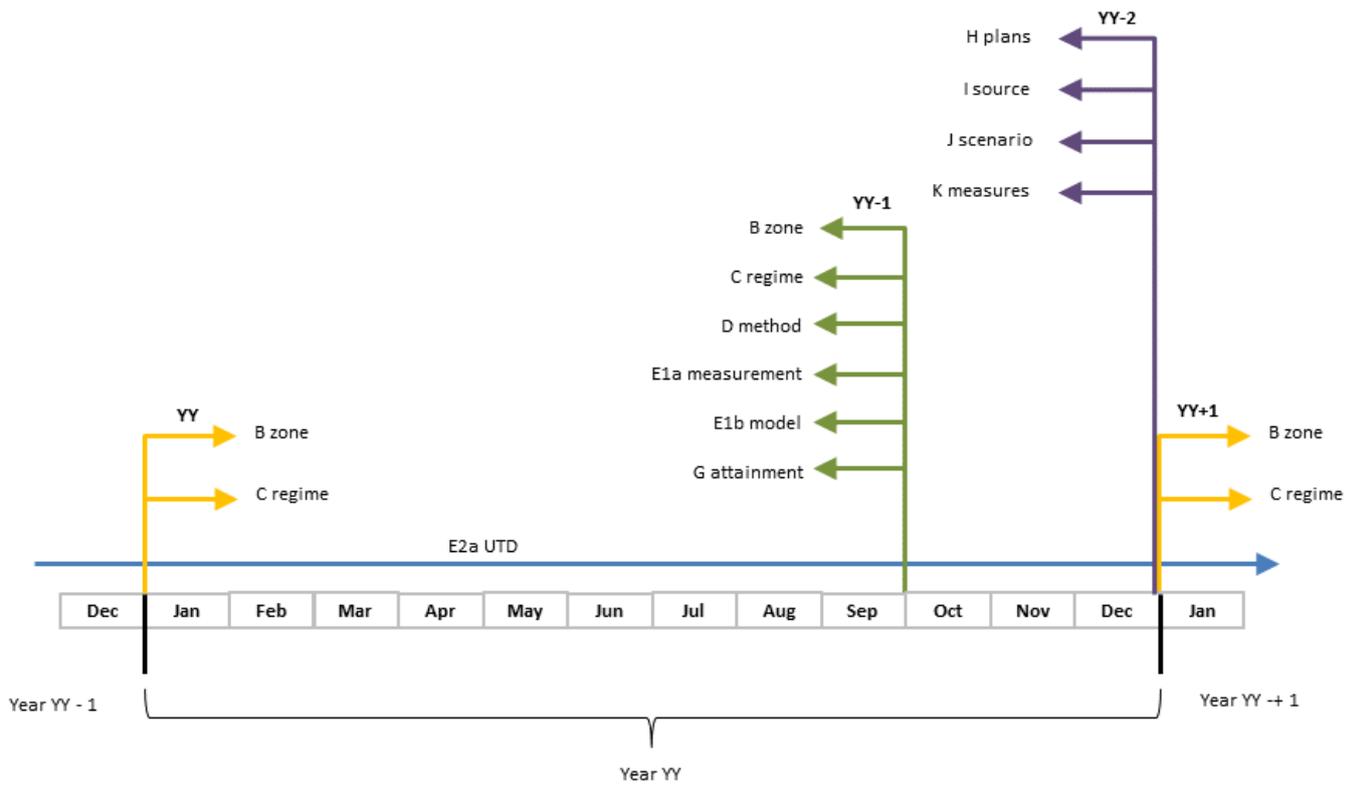

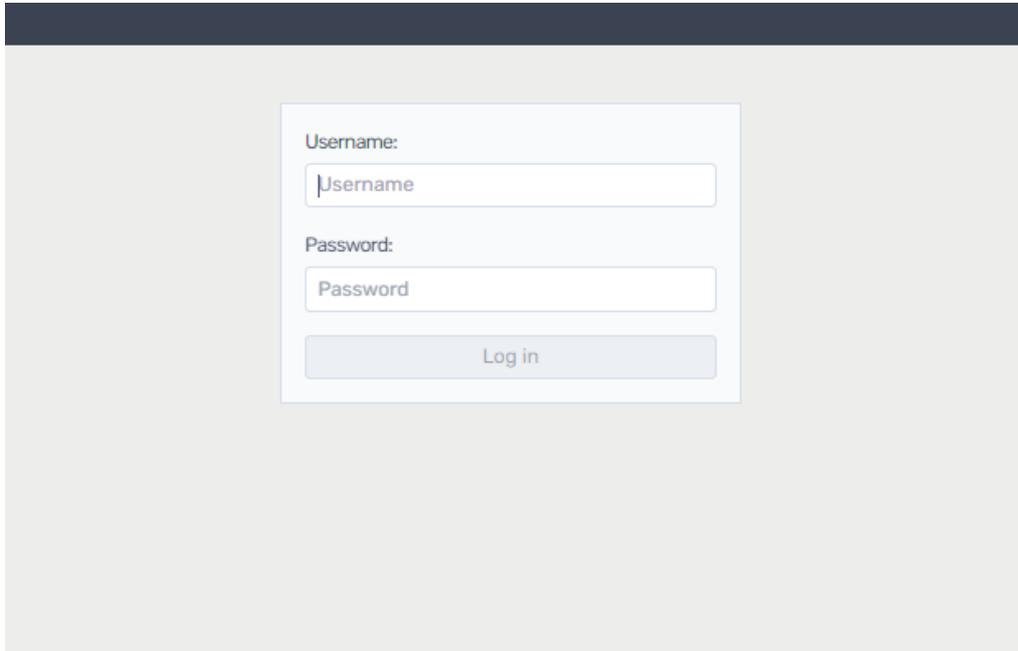

Figure 4: Reporting cycle – diagram from AQ Portal

4 Log in

To use Raven via GUI, logging is required. Go to the demonstration version at <https://admin.demo.aqraven.eu/login> By default, credentials are:

Username: admin

Password: admin

The image shows a login page with a dark blue header. Below the header is a light gray background. In the center, there is a white login form with a light blue border. The form contains two input fields: 'Username' and 'Password', each with a placeholder text of the same name. Below the fields is a light blue 'Log in' button.

Figure 5: Login page

Once logged in, the following page will open and on the top left appears a menu icon. This is used to hide the menu to navigate in Raven.

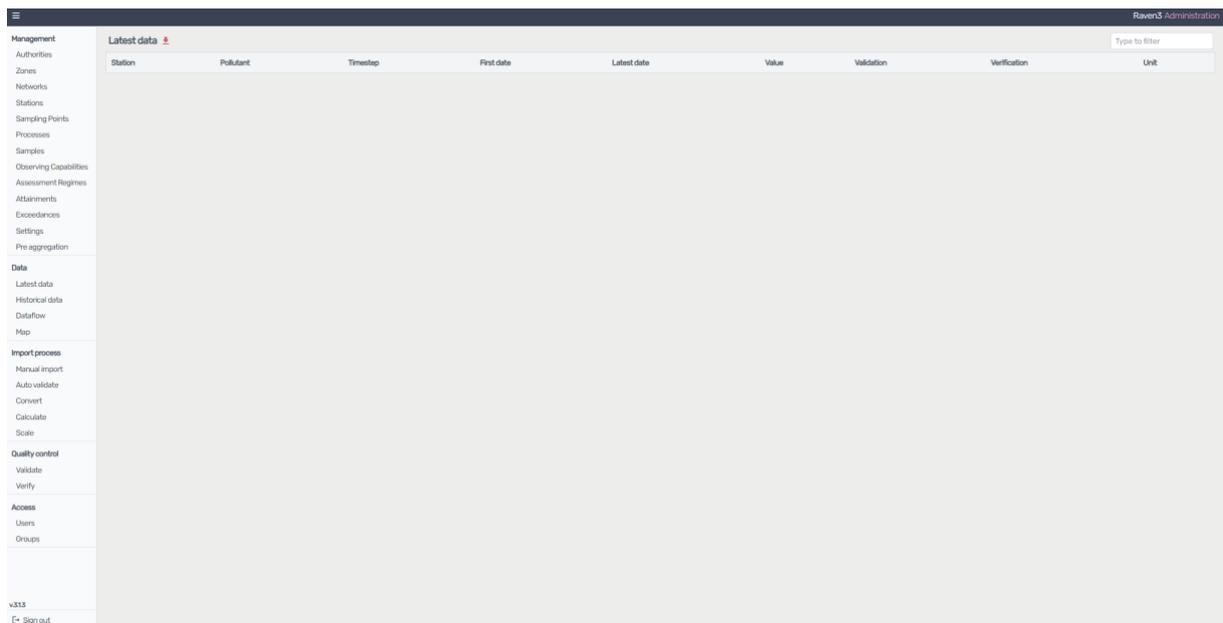

figure 6: Raven main page

Raven includes 5 main areas:

- Management
- Data
-
- Import process
- Quality control
- Access

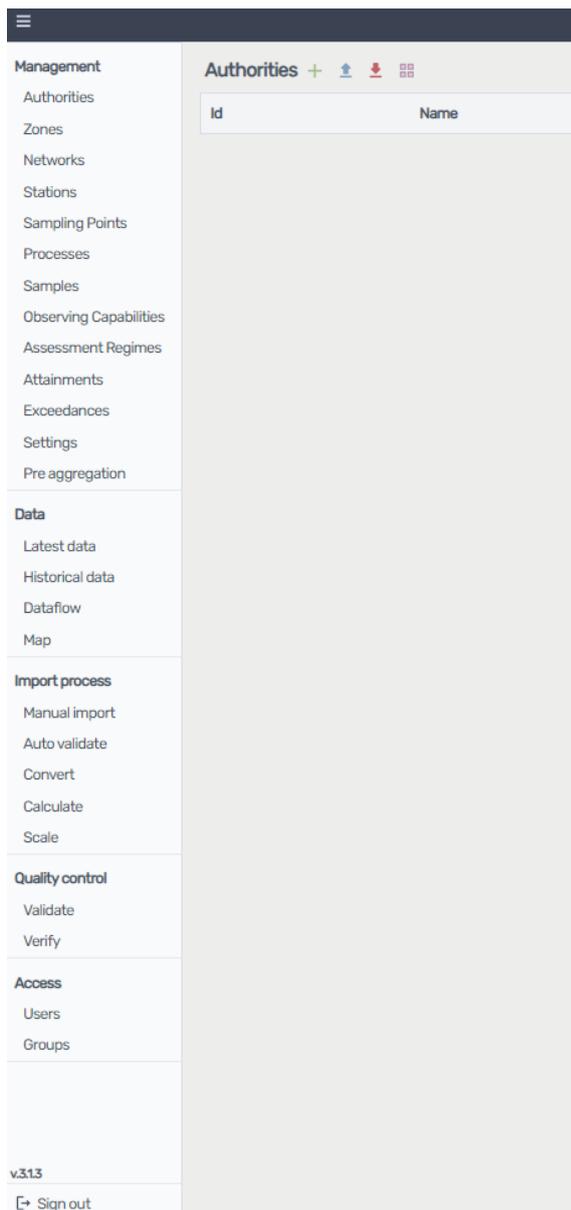

Figure 7: Raven's menu

NOTE: depending on the user group profile, the user will have access to different options within RAVEN.

5 Group profile

Raven's administrator can set up different user groups under the "Groups" section in the "Access" menu:

- Management
- Data
- EEA dataflow
- Processing

- Quality control
- Users
- All networks

The image shows a software interface for configuring a group profile. On the left, there is a sidebar with two tabs: 'Users' and 'All networks'. The 'All networks' tab is selected, and below it are two small square icons. The main area on the right is titled 'Required' and contains a 'Name:' field with the placeholder text 'str: A unique group name'. Below this are several checkboxes for permissions: 'Management', 'Data', 'EEA dataflow', 'Processing', 'Quality control', 'Users', and 'All networks'. At the bottom of the main area is a dropdown menu. At the bottom of the entire interface are two buttons: 'Save' and 'Cancel'.

Figure 8: Raven's group profile

Each group can be set up to have access to the following functions:

- Network user:
 - Networks
 - Stations
 - Processes
 - Assessment regime
 - Attainment
- Observations user:

- SamplingPoint
 - Samples
 - Observing capabilities
 - Observations
 - Historical data
- Export user:
 - Dataflows
- Quality control user:
 - Validate
 - Verify
- Processing
 - Scaled timeseries
 - Calculated timeseries
 - Converted timeseries
- Users:
 - Responsible authority
 - Users
 - Groups

On top of the functionalities, each individual group may have access to specific network. For example,

6 Management of meta-data

Raven provides a GUI to manage meta-data information for the different data flows:

- Dataflow D:
 - Responsible authorities
 - Networks
 - Stations
 - Sampling points
 - Processes
 - Samples
 - Observing capabilities
- Dataflow E1a/E2a
 - Observations
- Dataflow C
 - Assessment regime
- Dataflow G
 - Attainment
 - Exceedance Description

6.1 Data import with csv files via GUI or API

All meta-data is managed in a similar way regardless of dataflow. To import data for the first time, download the csv template from https://git.nilu.no/eea-tools/raven/-/tree/master/csv_examples and fill in the meta-data information according to e-Reporting requirements (see section 0). Figure 9 shows an example of CSV containing information on Authority.

responsible_authorities									
id	name	organisation	address	locator	postcode	email	phone	website	is_responsible_reporter
AU1	Valentyna Vasylenko	MENR	Vasyliia Lypkivskoho Street 35	Kyiv		vasilenko@menr.gov.ua		http://www.menr.gov.ua	TRUE

Figure 9: CSV example of Authority

Click on the specific element to import data (See Figure 10 for Authorities) and the corresponding page will open as seen in Figure 11.

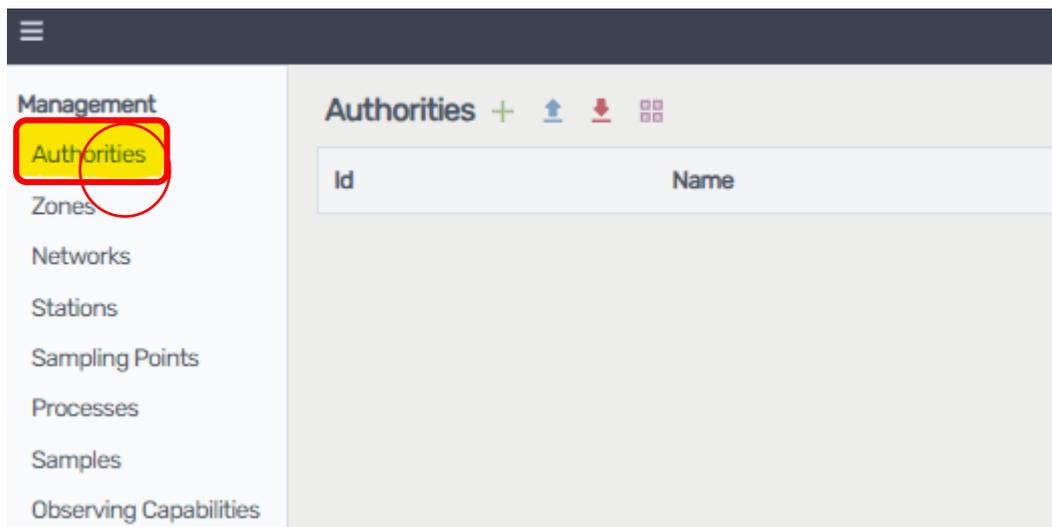

Figure 10: Select Authorities section

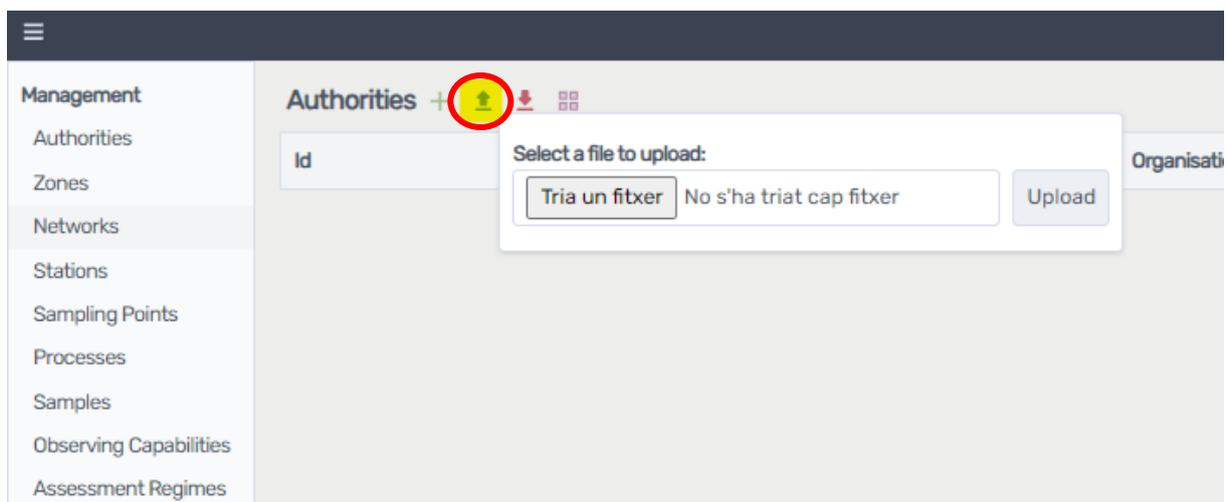

Figure 11: Authority GUI page

To import the CSV, click on the “Select a file” icon as seen in Figure 12 and look for the CSV file in your computer. Once selected, click on “Upload” button. If CSV is complete and correctly formatted, it will be uploaded successfully.

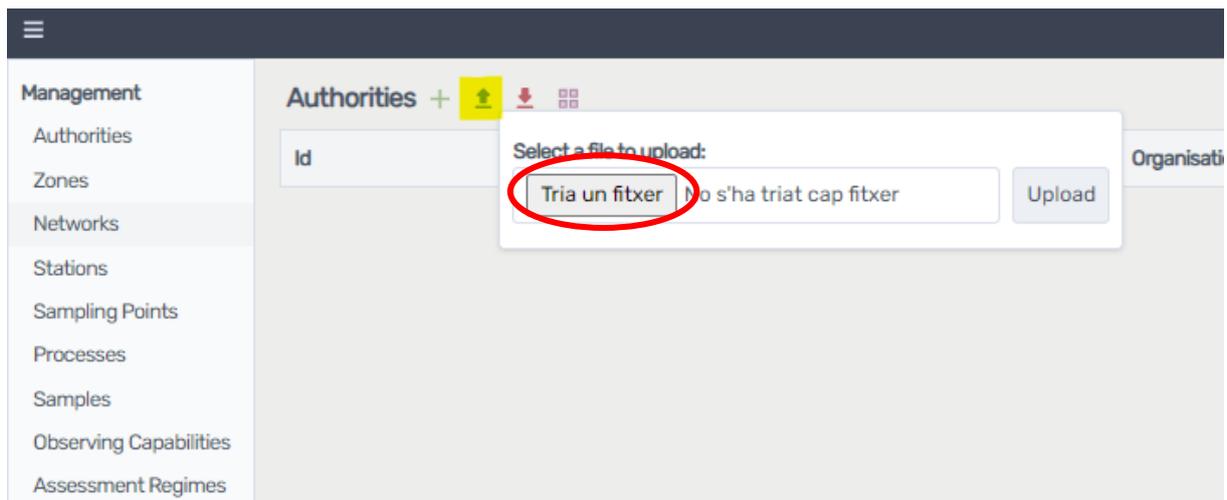

Figure 12: Authority GUI page

These steps will be necessary for all dataflows.

6.2 View data

Data imported into Raven can be visualised using the lateral menu. Click on the specific element to view data (See Figure 13 for Authorities) and the corresponding page will open as seen in Figure 14. Now the imported data is shown in tabular format.

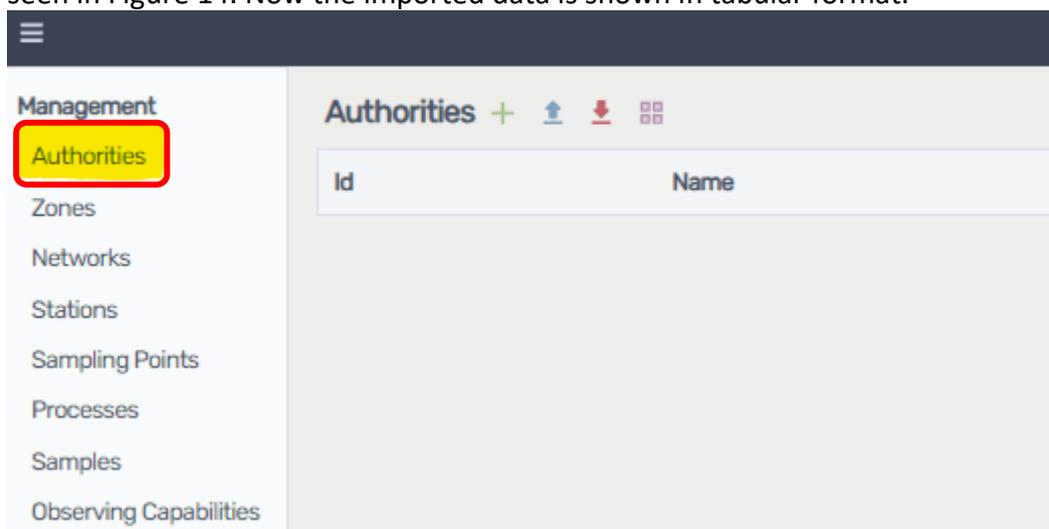

Figure 13: Select Authorities section

Id	Name	Organisation	Locator	Postcode
RA_ME1	DjukanovicGordana	Environmental Protection Agency of Montenegro	Podgorica	81000

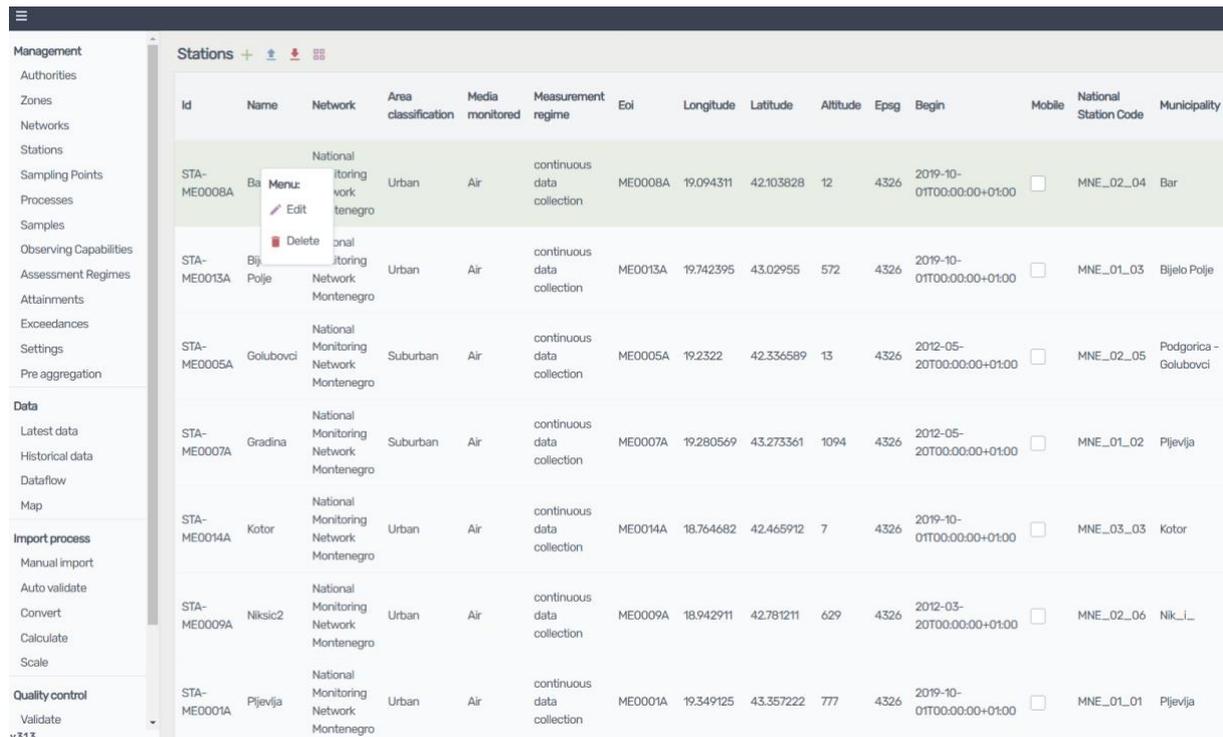

Figure 14: Authorities GUI page with imported data

6.3 Edit meta-data with GUI

Data can be edited via CSV or via GUI interface. If data is edited via CSV, amend the data in the CSV and re-upload the data following instruction in section 6.1).

Inside the specific GUI page, right click on the row to be edited. As seen in Figure 15, a menu appears with the following two options available:

- Edit
- Delete

The screenshot shows a web application interface for managing monitoring stations. On the left is a navigation sidebar with categories: Management (Authorities, Zones, Networks, Stations, Sampling Points, Processes, Samples, Observing Capabilities, Assessment Regimes, Attainments, Exceedances, Settings, Pre aggregation), Data (Latest data, Historical data, Dataflow, Map), Import process (Manual import, Auto validate, Convert, Calculate, Scale), and Quality control (Validate). The main area is titled 'Stations' and contains a table with columns: Id, Name, Network, Area classification, Media monitored, Measurement regime, Eoi, Longitude, Latitude, Altitude, Epsg, Begin, Mobile, National Station Code, and Municipality. A context menu is open over the first row (STA-ME0008A), showing 'Edit' and 'Delete' options. The table data is as follows:

Id	Name	Network	Area classification	Media monitored	Measurement regime	Eoi	Longitude	Latitude	Altitude	Epsg	Begin	Mobile	National Station Code	Municipality
STA-ME0008A	Bar	National Monitoring Network Montenegro	Urban	Air	continuous data collection	ME0008A	19.094311	42.103828	12	4326	2019-10-01T00:00:00+01:00	<input type="checkbox"/>	MNE_02_04	Bar

Figure 15: Authority GUI page with imported data

Edit will allow the update of meta-data row using the form as seen in Figure 16. Once information is updated, click on “Save” to store this in the database or click “Cancel” to ignore any updates.

Required	Optional
Id: STA-ME0008A	National Station Code: MNE_02_04
Name: Bar2	Municipality: Bar
Network: National Monitoring Network Montenegro	City: str: City
Area classification: Urban	Street Width: int: Street Width
Media monitored: Air	Distance Junction: int: Distance Junction
Measurement regime: continuous data collection	Traffic Volume: int: Traffic Volume
Eoi: ME0008A	Heavy Duty Fraction: float: Heavy Duty Fraction
Longitude: 19,094311	Height Facade: float: Height Facade
Latitude: 42,103828	End: 00:00 +00:00
Altitude: 12	
Epsg: 4326	
Begin: 2019-10-01 00:00 +01:00	
Mobile: <input type="checkbox"/>	
Save	Cancel

Figure 16: Raven's meta-data edit form

To create a new entry to the specific meta-data, click the green cross as seen in Figure 17. Then, enter the information as done before in Figure 13 and click on “Save” to store this in the database or click “Cancel” to ignore any new entry.

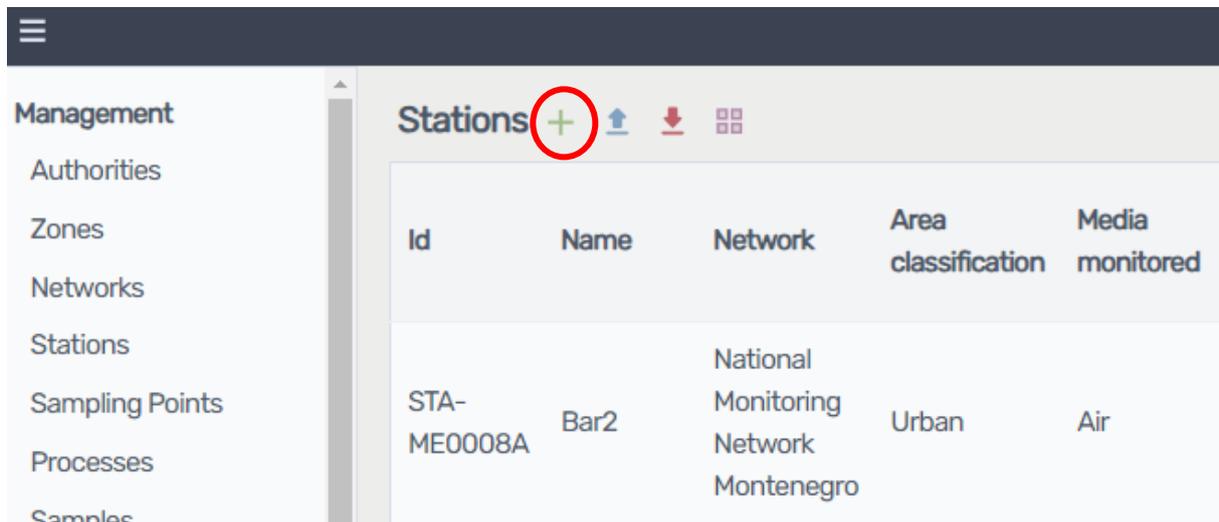

Figure 17: Raven's meta-data new entry

Delete will remove the particular row from the database.

6.4 Dataflow D

Under the IPR Decision, reporting countries must report on the assessment methods established for the purposes of air quality assessment and management. The legal obligations for reporting are set out in [Article 7 & 8 of the Decision](#).

A retrospective report must be reported by 30 September each year to confirm the methods that the reporting country implemented for the assessment and management of air quality. However, data flow D should be kept up to date as far as possible throughout the year to ensure correct processing of UTD data.

Retrospective (backward-looking) report by 30 September in year X to inform on country's AQ assessment methods for year X-1. In practice, dataset D should be kept updated as far as possible.

The metadata for fixed and indicative measurements is grouped into:

- AQD_Network
- AQD_Station
- AQD_SamplingPoint
- AQD_SamplingPointProcess
- AQD_Sample

Some elements are linked to others and these relationships are important for reporting metadata correctly.

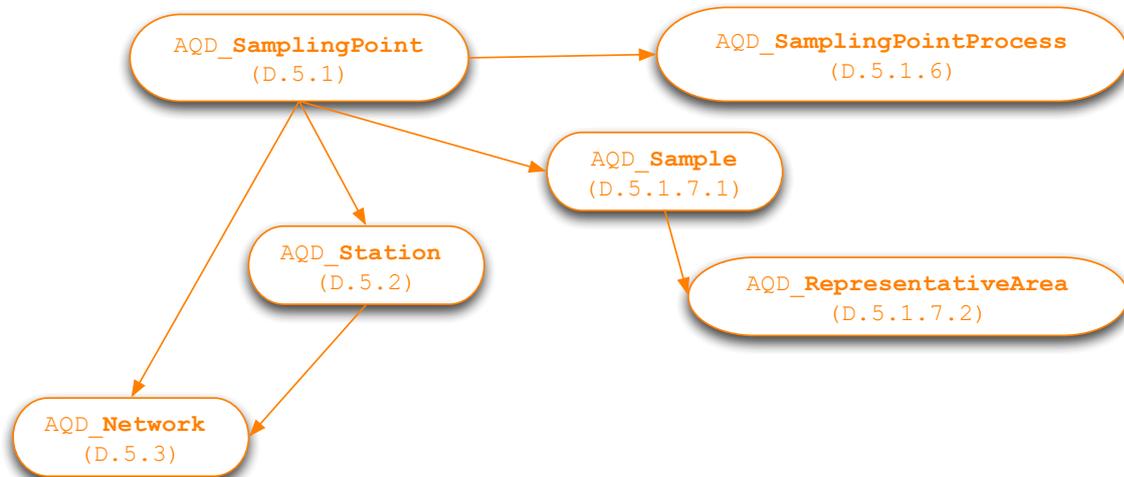

Figure 18: Linkages between fixed measurement elements (simple example) – from the User Guide

In Raven, the above configuration is carried out via 7 data templates:

- Networks
- Stations
- Sampling points
- Processes
- Samples
- Observing capabilities (which links all the elements)

6.5 Dataflow E1a/E2a

Under the IPR Decision, each country must report measurement data from all Assessment Methods established for the purposes of air quality assessment and management and exchange of information. The legal obligations for reporting of these data are set out in [Article 10](#).

For assessment data from fixed and indicative measurements, data flow E shall be reported as Primary validated assessment data (**E1a**).

The primary validated data is a mandatory data flow for pollutants with environmental objectives covered by Directive 2004/107/EC and Directive 2008/50/EC.

Data flow E1a links to

- Assessment Methods (D) linkage to AQD_SamplingPoint
- Assessment Methods (D) linkage to AQD_SamplingPointProcess
- Assessment Methods (D) linkage to AQD_Sample

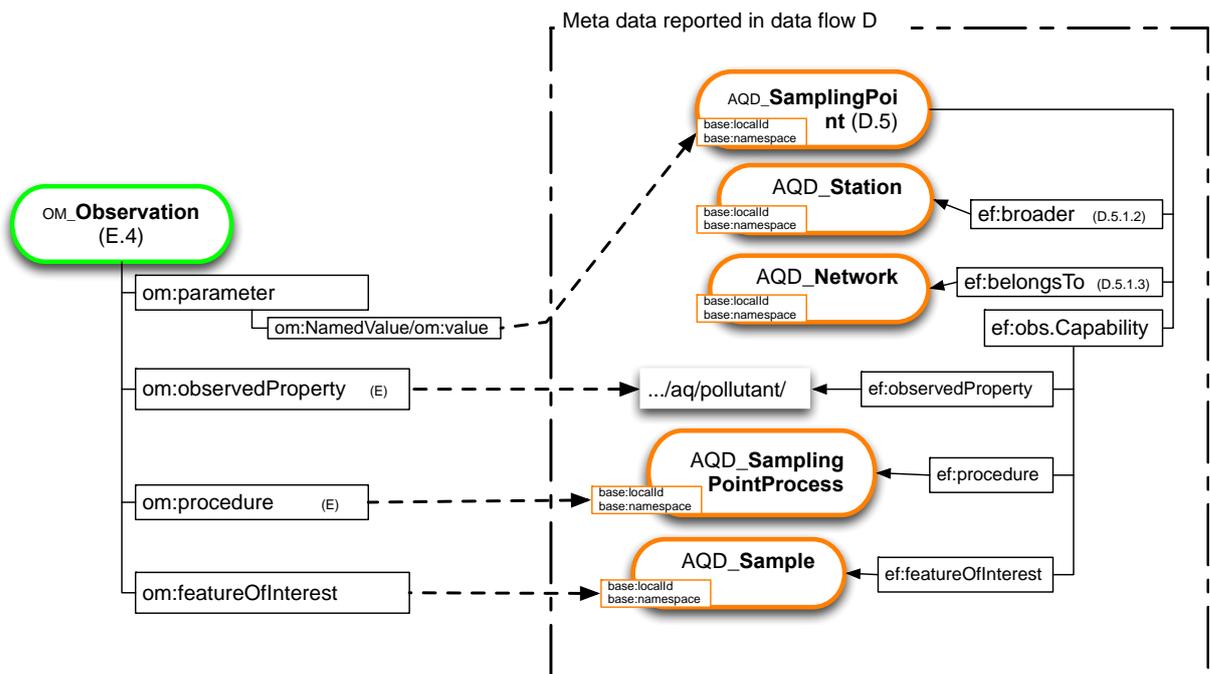

Figure 19: Key linkage between E1a and D

Raven ensures that the relationship of key elements is maintained. To link the observation with the timeseries, the user only needs to specify the samplingpoint ID in the Observations template

6.6 Dataflow C

The Assessment Regime data flow allows for comprehensive description of the assessment methods used in each zone to fulfill the air quality directive. This obligation is set out in [Article 7 of the Decision](#).

The Air Quality Assessment Regime data flow is a mandatory data flow for pollutants covered by Directive 2004/107/EC and Article 4 of Directive 2008/50/EC. The table below lists all mandatory pollutants including their related Protection Target. In addition, information about designated competent authorities and bodies responsible for different aspects of quality assurance must be provided under this data flow.

Data flow C must be reported in the following envelopes:

- **C_preliminary**
Forward looking report by 31st December each year with Assessment Regime for the management of air quality in the coming calendar year (year X+1).
- **Retrospective**
Report by 30 September in year X to inform on the AQ Assessment for year X-1

Each assessment regime Environmental objective type is a complex datatype with 3 elements used for describing the applicable AQ environmental objective as a combination of its components:

- Objective Type,
- Reporting Metric and
- Protection Target.

Pollutant*	objectiveType**	reportingMetric***	protectionTarget****

* <http://dd.eionet.europa.eu/vocabulary/aq/pollutant/>** <http://dd.eionet.europa.eu/vocabulary/aq/objectivetype/>***
<http://dd.eionet.europa.eu/vocabulary/aq/reportingmetric/>***<http://dd.eionet.europa.eu/vocabulary/aq/protectiontarget/>
**** *Currently not reported*

In Raven, the above configuration is carried out via one data templates:

- Assessment regime

6.7 Dataflow G

The Attainment data flow (G) Under the IPR Decision, provides information on the attainment (or otherwise) of the environmental objectives set by AQ Directives. This data flow allows for comprehensive description of the declaration of attainment for all environmental objectives in each zone or agglomeration. This obligation is set out in [Article12 of the Decision](#).

Key information to be reported includes:

- (i) Links to the AQ zone (data flow B) for the same calendar year,
- (ii) Links to the assessment regimes declared within data flow C for the same zone and calendar year
- (iii) Declaration of exceedance as TRUE or FALSE.
- (iv) Numerical exceedance or number exceedance for the Environmental Objective
- (v) Links to the exceeding assessment methods(s) declared with data flow D and D1b

The AQ attainment data flow is a mandatory data flow for pollutants with environmental objectives covered by Directive 2004/107/EC and Directive 2008/50/EC. Confirmation of exceedances of the Information and Alert thresholds based on valid measurements for pollutants that have these thresholds is excluded from the Attainment data flow.

Data flow G must be reported:

- Retrospective (backward-looking) report by 30 September in year X to inform on the AQ Attainment for year X-1

In Raven, the above configuration is carried out via two data templates:

- Attainment
- Exceedance Description

7 XML generation via download or API

Raven platform allows the generation of the XML to be reported to EEA for all dataflows. Click on the Dataflows section from main menu.

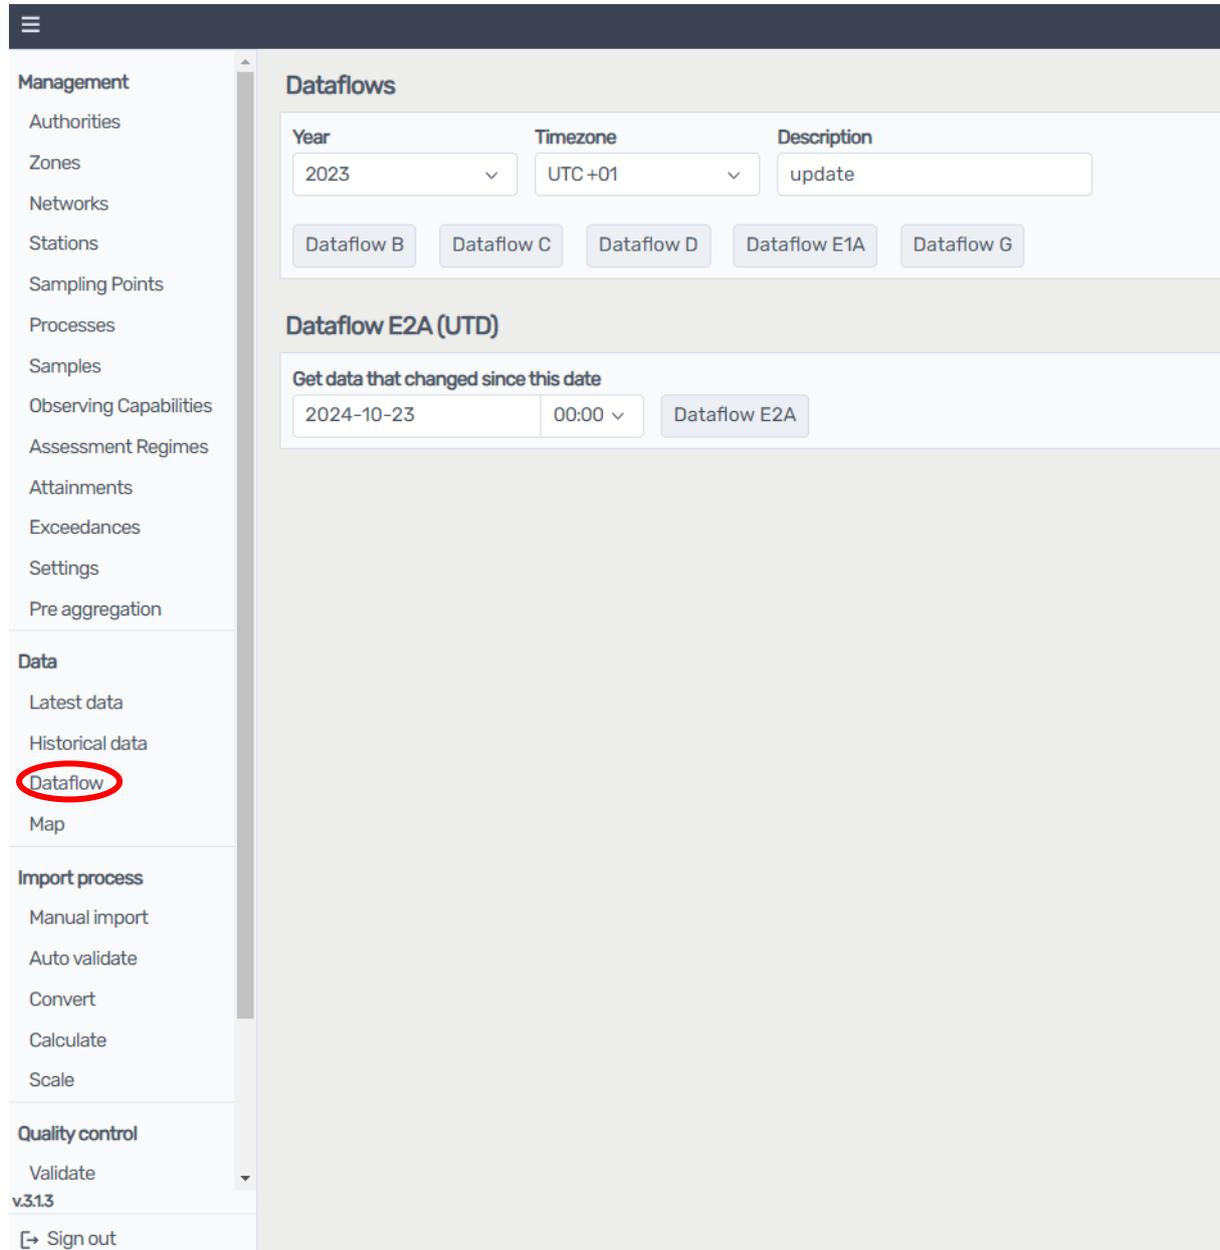

Figure 20: Dataflows section for XML export

Select the **Year**, the **time zone** and provide a **Description** and click on the specific "Dataflow" to export Raven.

However, before we can download the data according to the 'Dataflow' of interest, we must make sure that all the files needed for the analysis are correctly uploaded to Raven. So, for each Dataflow we need different files:

- **Dataflow B:** Authorities & Zones
- **Dataflow D:** Network, Stations, Sampling Points, Processes, Samples & Observing Capabilities.

- **Dataflow C:** Assessment Regimes & all the documents that have been previously uploaded to *Dataflow D and B*.
- **Dataflow G:** Attainments, Exceedances & all documents required for *Dataflow C*.
- **Dataflow E1a:** This can be done in two different ways, through a manual import (in the 'Import process' side menu) or automatically (better specify how).

Figure 21: Dataflows export section

ADD API to generate all dataflows

8 Management of timeseries

Raven provides a GUI to visualise air quality monitoring data which has been imported into Raven (Historical data) and visualise latest data in tabular format (Latest data). . Moreover, it includes two new functionalities to...

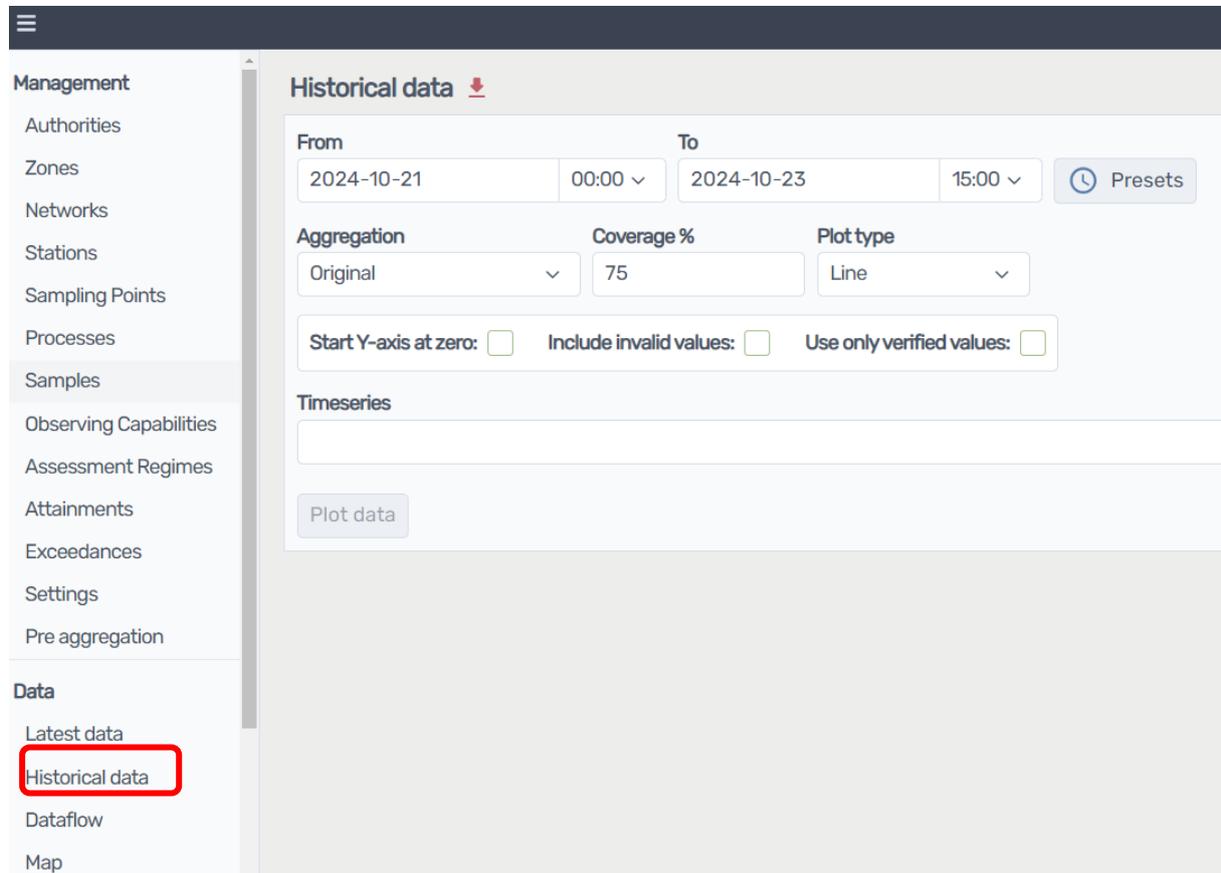

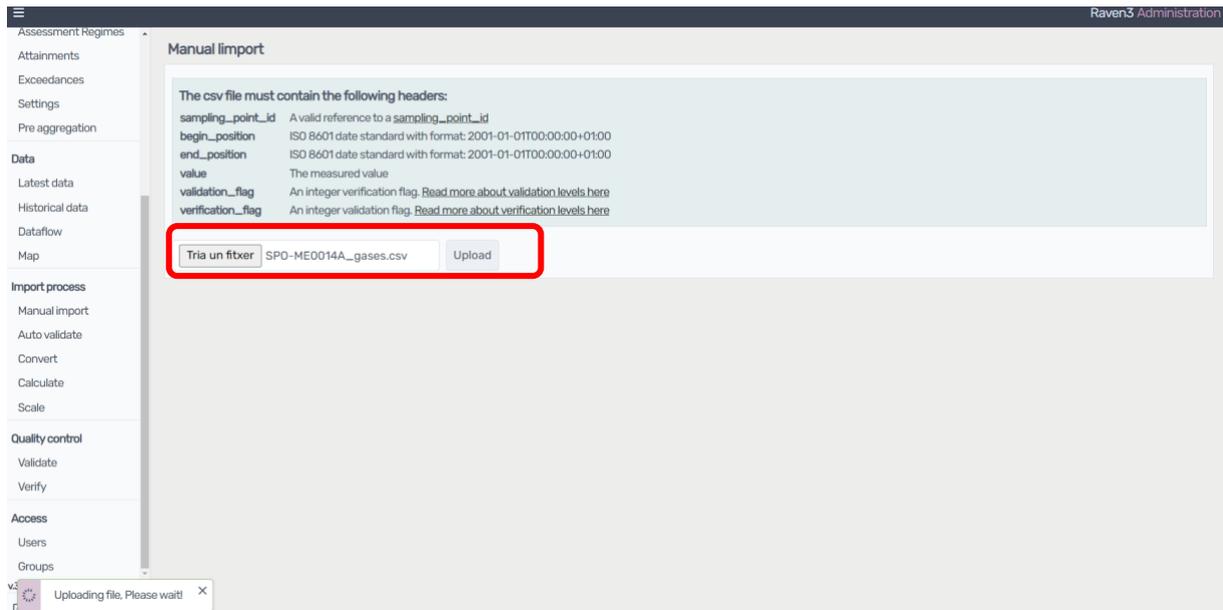

Figure 24: Historical data section for visualising timeseries

In order to visualise the data, first we must follow the steps specified on page 39 & 40, then, the following steps are necessary:

- 1) Firstly, import the data in the section Data > Manual import as shown in Figure X (need to check which number figure is it)

- 2) Select the period of interest in the “From” (day + hour) and “To” (day + hour) section. There’s the “Presets” option that let you choose automatically:
 - a. This week
 - b. Last week
 - c. This month
 - d. Last month
 - e. This year
 - f. Last year
- 3) Select how data should be displayed regarding the type of “Aggregation”
- 4) Choose the “Coverage (%)” percentage
- 5) Choose the “Plot type”, line or bar graph
- 6) There’s the option to choose if you want to display or change the following parameters in the graphic:
 - a. Start Y-axis at zero
 - b. Include invalid values
 - c. Use only verified values
- 7) Finally, select the “Timeseries” to be displayed on the graph

Historical data ↓

From: 2023-01-01 00:00 To: 2024-10-24 11:00 Presets

Aggregation: Original Coverage %: 75 **Plot type: Bar**

Start Y-axis at zero: Include invalid values: Use only verified values:

Timeseries

Bar2, NO, Hour, µg/m³ Bar2, NO₂, Hour, µg/m³ Bar2, NOX as NO₂, Hour, µg/m³ Bar2, O₃, Hour, µg/m³

Plot data

Figure 32: Historical data section – select data as a **bar** graph in the “Plot type” drop-down

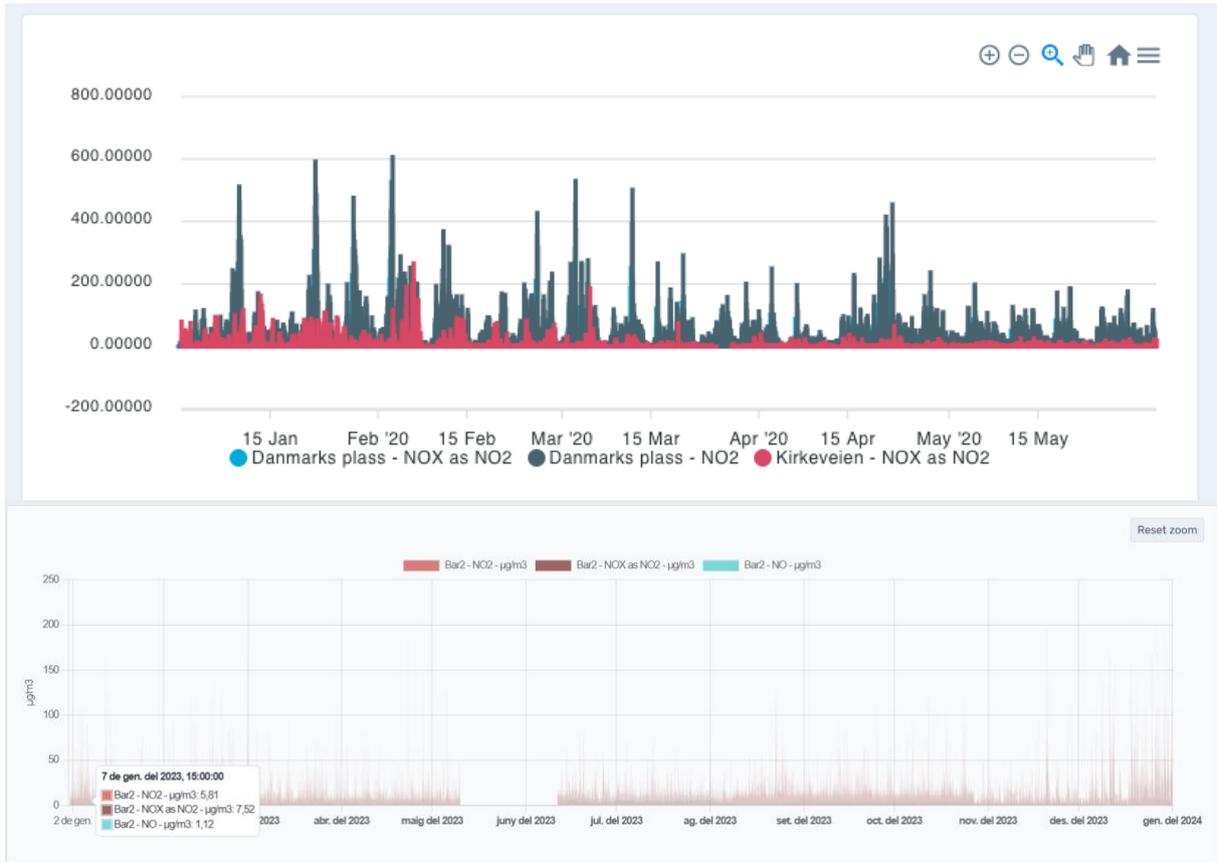

Figure 33: Historical data section – visualise data as a bar graph

9 Data processing

Raven allows the processing of data timeseries. Currently, it includes 3 options:

- Convert -
- Calculate
- Scale

9.1 Scaled timeseries (validate)

In this section is possible to observe that the original value is higher than the imported value, which is the one that is selected as it's the one that has been validated through the varification number applied.

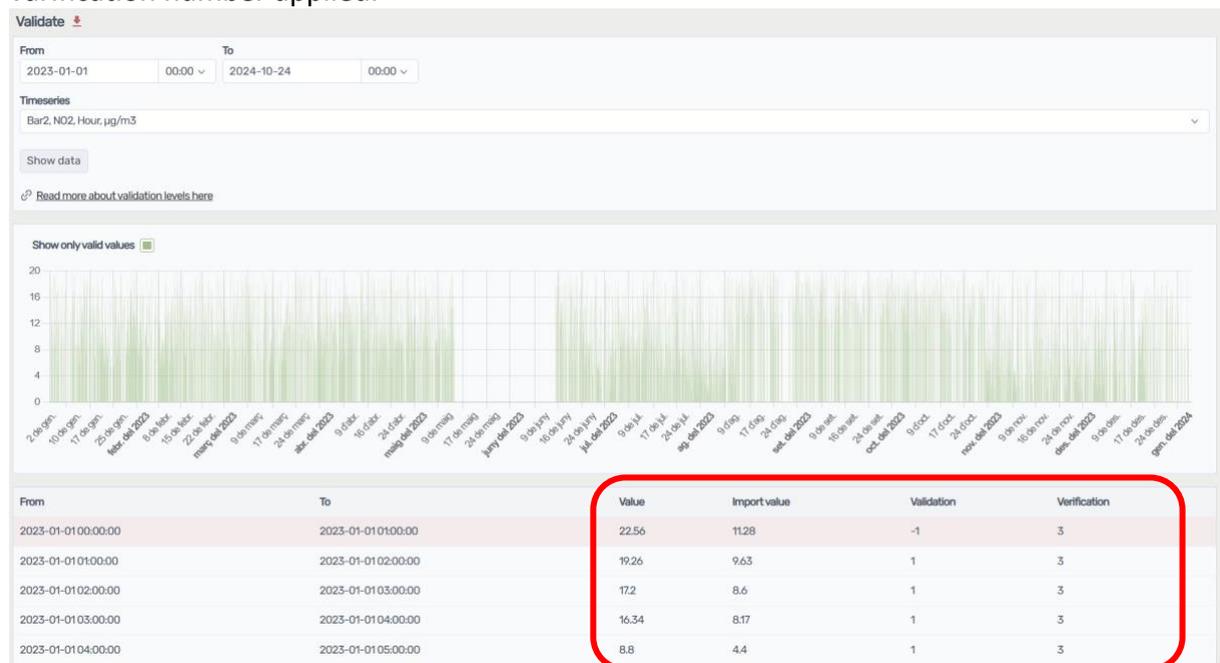

Figure ??: Quality control section – selection of the validated data

9.2 Calculated timeseries

9.3 Converted timeseries

In this section there's the possibility to convert the units from the data uploaded; in this case, for example, the initial units are ppbv and they've been converted into µg/m3. There multiple options & units to convert the data depending on the need of the analysis.

Station	Pollutant/Metaco	Timestep	Source	Target	Factor
Bar2	NO2	Hour	ppbv	µg/m3	2

10 Key elements for AQ e-Reporting (under development)

Under development.

11 Import of data – Manual import

To import data manually, go to the 'Import process' section in the side menu. Then, click on 'Manual import' where you should upload the files in '.csv' format needed to make the different graphs selecting your file ("Select your file") and then "Upload" it pressing the corresponding button as shown in Figure X.

Manual import

The csv file must contain the following headers:

sampling_point_id	A valid reference to a sampling_point_id
begin_position	ISO 8601 date standard with format: 2001-01-01T00:00:00+01:00
end_position	ISO 8601 date standard with format: 2001-01-01T00:00:00+01:00
value	The measured value
validation_flag	An integer verification flag. Read more about validation levels here
verification_flag	An integer validation flag. Read more about verification levels here

Tria un fitxer No s'ha triat cap fitxer Upload

Figure ??: Manual import section – Select a file & Upload buttons to ensure the csv files is uploaded in Raven.

These files must contain the following headings, as shown below and in Figure X:

- **sampling_point_id**: A valid reference to a [sampling_point_id](#)
- **begin_position**: ISO 8601 date standard with the format 2001-01-01T00:00:00+01:00
- **end_position**: ISO 8601 date standard with the format 2001-01-01T00:00:00+01:00
- **value**: The measured value
- **validation_flag**: An integer verification flag.
- **verification_flag**: An integer verification flag.

12 Common errors

Under development.

- When trying to upload csv file in “Observing Capabilities” we get the following error:

- Dataflow by
- Not uploading D in full
- Under E1a upload data with the wrong frequency (Metadata says A and data says hourly)
- Data with mixed time zone
- Hourly data with hours that extend for more than one hour
- Uploading D Dataflows in the wrong order
- Uploading C without zones and metadata
- TimeSeries – In the Historical data maybe would be good to specify that is not only that, it's also the pollutant, ubication...
- In the map section:
 - o The zoom in and out options (cross and minus), there's something that underlines the icons and it's confusing...
 - o Also, when displaying some images from the stations on the map, the icons
